

Logical and Geometrical Complementarities between Aristotelian Diagrams

Hans Smessaert and Lorenz Demey

Diagrams 2014, Melbourne

Introduction: Diagrams and Subdiagrams

central idea: **subdiagrams** / diagram embedding / diagram nesting

- smaller diagrams occur inside bigger diagrams
- Euler diagrams (Fish & Flower 2008), Venn diagrams (Flower, Stapelton & Rogers 2013), spider diagrams (Urbas, Jamnik, Stapelton & Flower 2012) or algebra diagrams (Cheng 2012)
- visual nesting and recursion (Engelhardt 2006): “*any object may contain a set of (sub-)objects within the space that it occupies. When this principle is repeated recursively, the spatial arrangement of (sub-)objects is, at each level, determined by the specific nature of the containing space at that level.*”
- set of transitively nested substates of a composite state (Jin, Esser & Janneck 2002): “*in every UML statechart there is an inherent composite state called the **top state** which covers all the (pseudo) states and is the container of the states.*”

Introduction: Diagrams and Subdiagrams

central diagram: **rhombic dodecahedron (RDH)**

- Smessaert (2009/2012), Demey (2012)
- 3D representation for the visualisation of the Aristotelian relations between 14 contingent formulas.

central aims of talk

- to develop strategies for systematically charting the internal structure of the RDH
- to study various complementarities between Aristotelian diagrams inside the RDH
- to provide a more unified account of a whole range of diagrams which have so far mostly been treated independently of one another in the literature

- 1 Introduction
- 2 Aristotelian Relations in the Rhombic Dodecahedron
- 3 Aristotelian Squares of Opposition
- 4 Aristotelian Hexagons of Opposition
- 5 Aristotelian Octagons of Opposition
- 6 Complementarities in the Rhombic Dodecahedron
- 7 Conclusion

- 1 Introduction
- 2 Aristotelian Relations in the Rhombic Dodecahedron
- 3 Aristotelian Squares of Opposition
- 4 Aristotelian Hexagons of Opposition
- 5 Aristotelian Octagons of Opposition
- 6 Complementarities in the Rhombic Dodecahedron
- 7 Conclusion

Aristotelian Relations

- Informally, two formulas are:

contradictory iff they cannot be true together and cannot be false together
contrary iff they cannot be true together, but can be false together
subcontrary iff they can be true together, but cannot be false together
 in ***subalternation*** iff the first logically entails the second, but not vice versa

- Formally (relative to a logical system S), two formulas φ, ψ are

<i>contradictory</i>	iff	$S \models \neg(\varphi \wedge \psi)$	and	$S \models \neg(\neg\varphi \wedge \neg\psi)$
<i>contrary</i>	iff	$S \models \neg(\varphi \wedge \psi)$	and	$S \not\models \neg(\neg\varphi \wedge \neg\psi)$
<i>subcontrary</i>	iff	$S \not\models \neg(\varphi \wedge \psi)$	and	$S \models \neg(\neg\varphi \wedge \neg\psi)$
in <i>subalternation</i>	iff	$S \models \varphi \rightarrow \psi$	and	$S \not\models \psi \rightarrow \varphi$

- Formulas which do **not** stand in any Aristotelian relation are said to be ***unconnected*** or ***logically independent***.

Pairs of Contradicories

Partitioning the formulas from Classical Propositional Logic with two propositional variables p and q into **Pairs of Contradicories (PCDs)**

- 4 PCDs of **type C** ('cube')

$$\begin{array}{llll} \text{a. } (p \wedge q) & \text{b. } \neg(p \rightarrow q) & \text{c. } \neg(p \leftarrow q) & \text{d. } \neg(p \vee q) \\ \text{a'. } \neg(p \wedge q) & \text{b'. } (p \rightarrow q) & \text{c'. } (p \leftarrow q) & \text{d'. } (p \vee q) \end{array}$$

- 3 PCDs of **type O** ('octahedron') + 1 non-contingent PCD

$$\begin{array}{llll} \text{e. } p & \text{f. } q & \text{g. } (p \leftrightarrow q) & \text{h. } p \wedge \neg p \\ \text{e'. } \neg p & \text{f'. } \neg q & \text{g'. } \neg(p \leftrightarrow q) & \text{h'. } p \vee \neg p \end{array}$$

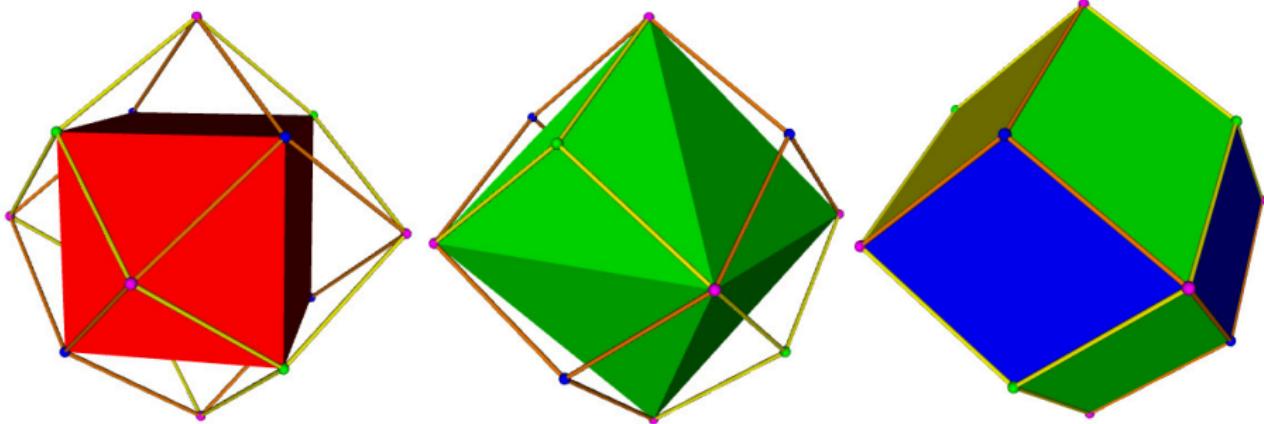

- Distinction between **levels**:

$$\begin{array}{llll} (\text{a-d}) & = & \text{Level 1} & \Rightarrow \text{pairwise } \textit{contraries} \\ (\text{a'-d'}) & = & \text{Level 3} & \Rightarrow \text{pairwise } \textit{subcontraries} \\ (\text{e-g}) + (\text{e'-g'}) & = & \text{Level 2} & \Rightarrow \text{pairwise } \textit{unconnected} \\ (\text{h-h'}) & = & \text{Level 0/4} & \Rightarrow \text{disregarded!} \end{array}$$

- 14 formulas/7 PCDs \Rightarrow 3D visualisation

The Rhombic Dodecahedron RDH

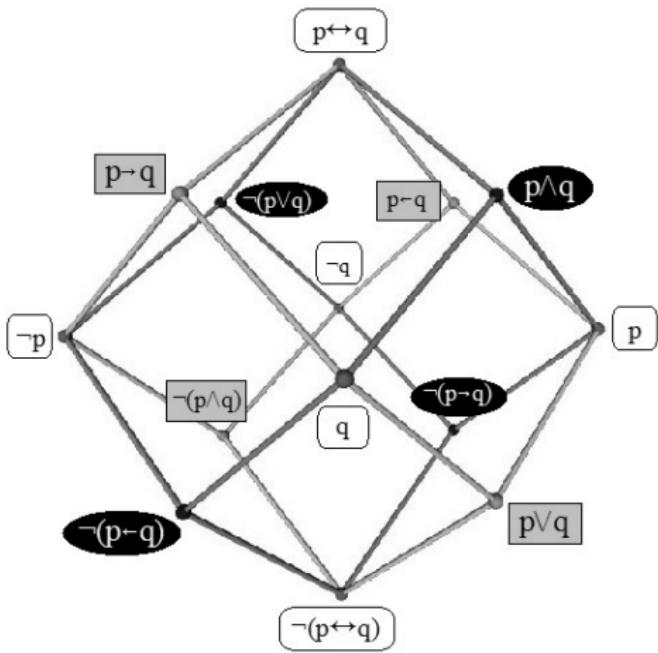

cube	+	octahedron	=	cuboctahedron	$\xrightarrow{\text{dual}}$	rhombic dodecahedron
Platonic 6 faces 8 vertices	Platonic 8 faces 6 vertices		Archimedean 14 faces 12 vertices		Catalan 12 faces 14 vertices	

central symmetry

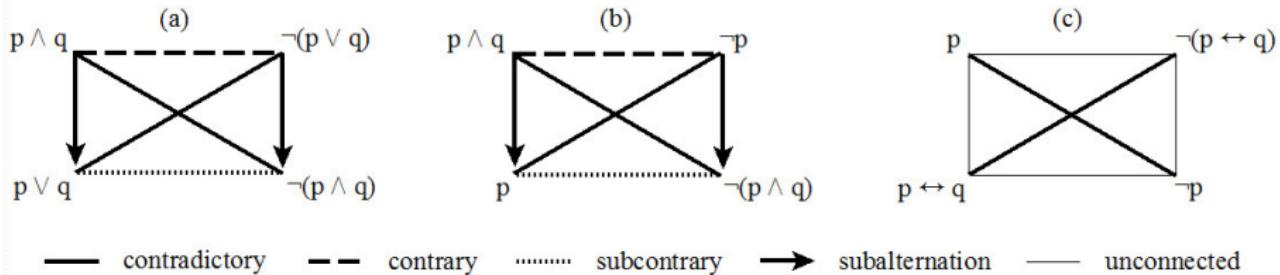

cube = 4 PCDs of type C (L1-L3)

octahedron = 3 PCDs of type O (L2-L2)

- 4 Aristotelian Hexagons of Opposition
- 5 Aristotelian Octagons of Opposition
- 6 Complementarities in the Rhombic Dodecahedron
- 7 Conclusion

Fundamental complementarity: $C_k O_\ell + C_{4-k} O_{3-\ell} = C_4 O_3 = RDH$

$$\begin{array}{c} C_4 O_0 \\ \text{cube} \end{array} + \begin{array}{c} C_0 O_3 \\ \text{octahedron} \end{array} = \begin{array}{c} C_4 O_3 \\ \text{RDH} \end{array}$$

C_2O_1a

- 3 Aristotelian Squares of Opposition
- 4 Aristotelian Hexagons of Opposition
- 5 Aristotelian Octagons of Opposition
- 6 Complementarities in the Rhombic Dodecahedron
- 7 Conclusion

Conclusion

develop strategies for systematically charting the internal structure of RDH

- distinguish families of *squares* in terms of 2 embedded *PCDs*
- distinguish families of *hexagons* in terms of 3 embedded *squares*
- distinguish families of *octagons* in terms of 4 embedded *hexagons*

study various complementarities between Aristotelian diagrams inside RDH

- difference in visual appeal \approx geometric difference (reflection symmetries)
- SC hexagons naturally come in pairs (Buridan octagon/rhombicube)
- JSB-Buridan complementarity respects this pairing
- SC-Béziau complementarity cuts across this pairing

provide a more unified account of a whole range of diagrams which have so far mostly been treated independently of one another in the literature

\Rightarrow exhaustive typology of RDH subdiagrams (combinatorial analysis)

Thank you!
